AZURE ARCHITECT TECHNOLOGIES TRACK (AZ-300)

Course Code: 100103

Learn to Deploy and Configure Infrastructure, Implement workloads and security, create and deploy Apps, Implement Authentication and Secure Data and develop for the Cloud and for Azure Storage.

This course teaches IT Professionals:

- How to manage their Azure resources, including deployment and configuration of virtual machines, virtual networks, storage accounts, and Azure AD that includes implementing and managing hybrid identities.
- Learn how cloud resources are managed in Azure through user and group accounts, and how to grant access to Azure AD users, groups, and services using Role-based access control (RBAC).
- Learn about the different storage accounts and services as well as basic data replication concepts and available replication schemes.
- Introduced to Storage Explorer as a convenient way to work with Azure storage data.
- Learn the types of storage and how to work with managed and custom disks.
- Azure blob storage is how Azure stores unstructured data in the cloud, and you will work with blobs and blob containers. In addition to blob storage, the course covers Table and Queue storage as storage options for structured data.
- Learn how to create and deploy virtual machines in Azure, using the Azure portal, PowerShell, and ARM templates. The course includes instruction on deploying custom images and Linux virtual machines. You will see how to configure the networking and storage components of virtual machines. Deploying highly available virtual machines is critical for planned and unplanned events, and you will learn how to use availability sets to ensure that virtual machine resources are available during downtime.
- Learn the monitoring tools and capabilities provided by Azure, including Azure Alerts and Activity Log. In addition to alerts and logs, you will be introduced to Log Analytics as an effective data analytics solution for understanding your system status and health. And perhaps the most exciting thing you will learn is how to use the Azure Resource Manager deployment model to work with resources, resource groups, and ARM templates.
- Discover, assess, plan and implement a migration of on-premises resources and infrastructure to Azure.
• Learn how to use Azure Migrate to perform the discovery and assessment phase that is critical to a successful migration. Students will also learn how to use Azure Site Recovery for performing the actual migration of workloads to Azure. The course focuses primarily on using ASR on a Hyper-V infrastructure to prepare and complete the migration process.

• Learn how to deploy serverless computing features like Azure Functions, Event Grid, and Service Bus. You will learn how Azure Multi-Factor Authentication helps safeguard access to data and applications, helping to meet customer demand for a simple sign-in process. Also, how to use Azure Active Directory Privileged Identity Management to manage, control, and monitor access to Azure resources within your organization.

• Manage and maintain the infrastructure for the core web apps and services that developers build and deploy.

• Learn how Azure App Service is used as a Platform as a Service (PaaS) offering for deploying cloud apps for web and mobile environments.

• Get a glimpse of how to implement advanced networking features like Application Gateway and how to configure load balancing. Learn to integrate on-premises networks with Azure virtual networks and to use Network Watcher to monitor and troubleshoot issues.

• Operations are done in parallel and asynchronously. And, how your whole enterprise system must be resilient when failures occur, and just as importantly, how deployments can be automated and predictable. By using the Azure Application Architecture Guide and Azure reference architectures as a basis, you will understand how monitoring and telemetry are critical for gaining insight into the system.

• You will dive into the cloud design patterns that are important, such as partitioning workloads where a modular application is divided into functional units that can be integrated into a larger application. In such cases, each module handles a portion of the application’s overall functionality and represents a set of related concerns.

• Load balancing where the application traffic, or load, is distributed among various endpoints by using algorithms. Load balancers allow multiple instances of your website to be created so they can behave in a predictable manner. In Azure, it is possible to use virtual load balancers, which are hosted in virtual machines, if a company requires a very specific load balancer configuration.

• Transient fault handling which helps define the primary differences between developing applications on-premises and in the to handle transient errors. Transient errors are errors that occur due to temporary interruptions in the service or to excess latency.

• Discussion of hybrid networking that provides an overview of site-to-site connectivity, point-to-site connectivity, and the combination of the two.

• To build Logic App solutions that integrate apps, data, systems, and services across enterprises or organizations by automating tasks and business processes as workflows. Logic Apps is cloud service in Azure that simplifies how you design and create scalable solutions for app integration, data
integration, system integration, enterprise application integration (EAI), and business-to-business (B2B) communication, whether in the cloud, on premises, or both.

• How Azure Service Fabric is a distributed systems platform that makes it easy to package, deploy, and manage scalable and reliable microservices and containers. Service Fabric also addresses the significant challenges in developing and managing cloud native applications. Developers and administrators can avoid complex infrastructure problems and focus on implementing mission-critical, demanding workloads that are scalable, reliable, and manageable. Service Fabric represents the next-generation platform for building and managing these enterprise-class, tier-1, cloud-scale applications running in containers.

• See how Azure Kubernetes Service (AKS) makes it simple to deploy a managed Kubernetes cluster in Azure. AKS reduces the complexity and operational overhead of managing Kubernetes by offloading much of that responsibility to Azure. As a hosted Kubernetes service, Azure handles critical tasks like health monitoring and maintenance for you.

• Learn how to implement authentication in applications (certificates, Azure AD, Azure AD Connect, token-based), implement secure data (SSL and TLS), and manage cryptographic keys in Azure Key Vault.

• Learn how to configure a message-based integration architecture, develop for asynchronous processing, create apps for autoscaling, and better understand Azure Cognitive Services solutions.

What You’ll Learn

• Managing Azure Subscriptions and Resources
• Implementing and Managing Storage
• Deploying and Managing VMs
• Configuring and Managing Virtual Networks
• Managing Identities using Azure Active Directory
• Evaluating and Performing Server Migration to Azure
• Implementing and Managing Application Services
• Implementing Advanced Virtual Networking.
• Securing Identities using Azure AD.
• Design and Connectivity Patterns
• Hybrid Networking
• Address Durability of Data and Caching
• Measure Throughput and Structure of Data Access
• Use shell commands to create an App Service Web App
• Create Background Tasks
• Use Swagger to document an API
• Create a reliable service
• Create a Reliable Actors app
• Hands-on with Reliable collections
• Understand the Azure Container Registry
• Use Azure Container instances
• Understand how to Implement authentication using certificates, Azure AD, Azure AD Connect, and tokens.
• Implement Role-aBsed Access Control (RBAC) authorization.
• Implement secure data for end-to-end encryption.
• Implement secure data for implementing SSL and TLS communications.
• Use Azure Key Vault to manage cryptographic keys.
• How to configure a message-based integration architecture
• Understand how to Develop for Asynchronous Processing
• Begin creating apps for Autoscali
• Understand Azure Cognitive Services Solutions

Who Needs to Attend

Successful Cloud Solutions Architects begin this role with practical experience with operating systems, virtualization, cloud infrastructure, storage structures, billing, and networking.

Prerequisites

Advanced knowledge about Azure, Azure administration and core software development principles. It would be helpful to have experience in an organization that delivers software.
AZURE ARCHITECT TECHNOLOGIES TRACK (AZ-300)

Course Code: 100103

CLASSROOM LIVE  $2,995 USD  5 days

Classroom Live Outline

AZ-300T01: Deploying and Configuring Infrastructure

Module 1: Managing Azure Subscriptions and Resources

In this module you will explore Azure monitoring capabilities using Azure alerts, Azure activity logs, and Log Analytics. You will learn to query, analyze, and interpret the data viewed in Log Analytics.

After completing this module, students will be able to:
  • Managing Azure Subscriptions and Resources

Module 2: Implementing and Managing Storage

In this module you will learn about Azure storage accounts, data replication, how to use Azure Storage Explorer, and monitor storage.

After completing this module, students will be able to:
  • Implementing and Managing Storage

Module 3: Deploying and Managing Virtual Machines (VMs)

• In this module you will learn how to do the following:
  • Create Virtual Machines (VM)s within the Azure Portal
  • Create Virtual Machines (VM)s using Azure PowerShell
  • Create Virtual Machines (VM)s using ARM templates
  • Deploy Linux Virtual Machines (VM)s
  • Monitor Virtual Machines (VM)s Additionally, you will learn how to protect data using backups at regular intervals, whether by snapshot, Azure Backup, or Azure Site Recovery.

After completing this module, students will be able to:
  • Deploying and Managing VMs
Module 4: Configuring and Managing Virtual Networks

In this module you will create and implement virtual networks using the Azure Portal as well as Azure PowerShell and CLI. You will receive and overview on how to assign IP addresses to Azure resources to communicate with other Azure resources, your on-premises network, and the Internet.

Lessons

- Network routing using routing tables and algorithms
- Inter-site connectivity using VNet-to-VNet connections and VPNs
- Virtual network peering for regional and global considerations
- Gateway transit

After completing this module, students will be able to:

- Configuring and Managing Virtual Networks

Module 5: Managing Identities

This module covers Azure Active Directory (Azure AD) for IT Admins and Developers with a focus on the Azure AD multi-tenant cloud-based directory and identity management service.

Lessons

- Role-Based Access Control (RBAC)
- built-in roles
- Self-Service Password Reset (SSPR)
- authentication methods for password reset

After completing this module, students will be able to:

- Managing Identities using Azure Active Directory

AZ-300T02: Implementing Workloads and Security

Module 1: Evaluating and Performing Server Migration to Azure

This module covers migrating workloads to a new environment, whether it be another datacenter, or to a public cloud, and setting clear goals for the migration. Goals include both technology-focused and business-focused goals for migrations, and the benefits to an organization’s business. Activities include components of the Azure migration process: creating a project, creating a collector, assessing readiness, and estimating costs. Additionally, you will receive and overview of Azure Site Recovery (ASR) that includes and end-to-end scenarios.

After completing this module, students will be able to:

- Evaluating and Performing Server Migration to Azure

Module 2: Implementing and Managing Application Services

This module includes the following topics:

- Deploying Web Apps
- Managing Web Apps
- App Service Security
• Serverless Computing Concepts
• Managing Event Grid
• Managing Service Bus
• Managing Logic App

After completing this module, students will be able to:
- Implementing and Managing Application Services

Module 3: Implementing Advanced Virtual Networking

This module includes the following topics:
- Azure Load Balancer
- Azure Application Gateway
- Site-to-Site VPN Connections
- As well as an overview of ExpressRoute which allows companies to extend on-premises networks into the Microsoft cloud over a dedicated private connection facilitated by a connectivity provider.

After completing this module, students will be able to:
- Implementing Advanced Virtual Networking

Module 4: Securing Identities

This module includes the following topics with an emphasis on identity and roles:
- Azure AD Identity Protection
- Azure Domains and Tenants
- Azure Users and Groups
- Azure Roles
- As well as an overview of Azure AD integration options that focuses on Azure AD Connect to integrate on-premises directories with Azure Active Directory

After completing this module, students will be able to:
- Securing Identities using Azure AD

AZ-300T03: Understanding Cloud Architect Technology Solutions

Module 1: Selecting Compute and Storage Solutions

This module includes the following topics:
- Azure Architecture Center
- Cloud design patterns
- Competing consumers pattern
- Cache-aside pattern
- As well as sharding patterns to divide a data store into horizontal partitions, or shards. Each shard has the same schema but holds its own distinct subset of the data.

After completing this module, students will be able to:
- Design and Connectivity Patterns

Module 2: Hybrid Networking

This module includes the following topics:
• Site-to-site connectivity
• Point-to-site connectivity
• Combining site-to-site and point-to-site connectivity
• Virtual network-to-virtual network connectivity As well as connecting across cloud providers for failover, backup, or even migration between providers such as AWS

After completing this module, students will be able to:
• Hybrid Networking

Module 3: Measuring Throughput and Structure of Data Access

This module includes the following topics:
• DTUs – Azure SQL Database
• RU – Azure Cosmos DB
• Structured and unstructured data
• Using structured data stores

After completing this module, students will be able to:
• Address Durability of Data and Caching
• Measure Throughput and Structure of Data Access

AZ-300T04: Creating and Deploying Apps

Module 1: Creating Web Applications using PaaS

This module provides an overview of Azure App Service Web Apps for hosting web applications, REST APIs, and a mobile back end. Topics include the following:
• Using shell commands to create an App Service Web App
• Creating Background Tasks
• Using Swagger to document an API

As well as an explanation of how Logic Apps help to build solutions that integrate apps, data, systems, and services across enterprises or organizations by automating tasks and business processes as workflows

After completing this module, students will be able to:
• Use shell commands to create an App Service Web App
• Create Background Tasks
• Use Swagger to document an API

Module 2: Creating Apps and Services Running on Service Fabric

This module provides an overview of Azure Service Fabric as a distributed systems platform that makes it easy to package, deploy, and manage scalable and reliable microservices and containers. This module also addresses the challenges in developing and managing cloud native applications. Additional topics include:
• Creating a reliable service
• Creating a Reliable Actors app
• Working with Reliable collections

After completing this module, students will be able to:
• Create a reliable service
• Create a Reliable Actors app
• Hands-on with Reliable collections

Module 3: Using Azure Kubernetes Service

This module focuses on the Azure Kubernetes Service (AKS) for deploying and managing a Kubernetes cluster in Azure. Topics include how to reduce operational overhead of managing Kubernetes by offloading much of that responsibility to Azure, such as health monitoring and maintenance. Additional topics include:

• Azure Container Registry
• Azure Container Instances

After completing this module, students will be able to:

Understand the Azure Container Registry
Use Azure Container instances

AZ-300T06: Developing for the Cloud

Module 1: Developing Long-Running Tasks and Distributed Transactions

Topics for this module include:

• Implementing large-scale, parallel, and high-performance apps using batches
• HPC using Microsoft Azure Virtual Machines
• Implementing resilient apps by using queues As well as, implementing code to address application events by using webhooks. Implementing a webhook gives an external resource a URL for an application. The external resource then issues an HTTP request to that URL whenever a change is made that requires the application to take an action

Module 2: Configuring a Message-Based Integration Architecture

Lessons

• Configure an app or service to send emails
• Configure an event publish and subscribe model
• Configure the Azure Relay service
• Configure apps and services with Microsoft Graph

After completing this module, students will be able to:

• How to configure a message-based integration architecture

Module 3: Developing for Asynchronous Processing

Lessons

• Implement parallelism, multithreading, and processing
• Implement Azure Functions and Azure Logic Apps
• Implement interfaces for storage or data access
• Implement appropriate asynchronous computing models
• Implement autoscaling rules and patterns

After completing this module, students will be able to:
  • Understand how to Develop for Asynchronous Processing

Module 4: Developing for Autoscaling

Lessons
  • Implementing autoscaling rules and patterns
  • Implementing code that addresses singleton application instances
  • Implementing code that addresses a transient state

After completing this module, students will be able to:
  • Begin creating apps for Autoscaling

Module 5: Developing Azure Cognitive Services Solutions

Lessons
  • Developing Solutions using Computer Vision
  • Developing solutions using Bing Web Search
  • Developing solutions using Custom Speech Service
  • Developing solutions using QnA Maker

After completing this module, students will be able to:
  • Understand Azure Cognitive Services Solutions

Module 6: Develop for Azure Storage

Lessons
  • Develop Solutions that use Azure Cosmos DB Storage
  • Develop Solutions that use a Relational Database
  • Modeling a Database by using Entity Framework Core
  • Develop Solutions that use Microsoft Azure Blob Storage
  • Manipulating Blob Container Properties in .NET

After completing this module, students will be able to:
  • Understand Azure Storage services such as blobs and Cosmos DB

Classroom Live Labs

Lab - Managing Azure Subscriptions and Resources
  • Exploring Monitoring Capabilities in Azure

Lab - Deploying and Managing Virtual Machines (VMs)
  • Implementing Custom Azure VM Images

Lab - Managing Identities
  • Implementing user-assigned managed identities for Azure resources

Lab - Evaluating and Performing Server Migration to Azure
  • Topic: Implementing Azure to Azure migration
Lab - Configuring and Managing Virtual Networks
  • Configuring VNet peering and service chaining
Lab - Implementing and Managing Storage
  • Implementing Azure Storage access controls
Lab - Securing Identities
  • Implementing custom Role Based Access Control (RBAC) roles
Lab - Implementing and Managing Application Services
  • Implementing Azure Logic Apps

VIRTUAL CLASSROOM LIVE $2,995 USD 5 days

Virtual Classroom Live Outline

AZ-300T01: Deploying and Configuring Infrastructure

Module 1: Managing Azure Subscriptions and Resources

In this module you will explore Azure monitoring capabilities using Azure alerts, Azure activity logs, and Log Analytics. You will learn to query, analyze, and interpret the data viewed in Log Analytics.

After completing this module, students will be able to:
• Managing Azure Subscriptions and Resources

Module 2: Implementing and Managing Storage

In this module you will learn about Azure storage accounts, data replication, how to use Azure Storage Explorer, and monitor storage.

After completing this module, students will be able to:
• Implementing and Managing Storage

Module 3: Deploying and Managing Virtual Machines (VMs)

• In this module you will learn how to do the following:
  • Create Virtual Machines (VM)s within the Azure Portal
  • Create Virtual Machines (VM)s using Azure PowerShell
  • Create Virtual Machines (VM)s using ARM templates
  • Deploy Linux Virtual Machines (VM)s
  • Monitor Virtual Machines (VM)s Additionally, you will learn how to protect data using backups at regular intervals, whether by snapshot, Azure Backup, or Azure Site Recovery.

After completing this module, students will be able to:
• Deploying and Managing VMs
Module 4: Configuring and Managing Virtual Networks

In this module you will create and implement virtual networks using the Azure Portal as well as Azure PowerShell and CLI. You will receive and overview on how to assign IP addresses to Azure resources to communicate with other Azure resources, your on-premises network, and the Internet.

Lessons

- Network routing using routing tables and algorithms
- Inter-site connectivity using VNet-to-VNet connections and VPNs
- Virtual network peering for regional and global considerations
- Gateway transit

After completing this module, students will be able to:

- Configuring and Managing Virtual Networks

Module 5: Managing Identities

This module covers Azure Active Directory (Azure AD) for IT Admins and Developers with a focus on the Azure AD multi-tenant cloud-based directory and identity management service.

Lessons

- Role-Based Access Control (RBAC)
  - built-in roles
- Self-Service Password Reset (SSPR)
  - authentication methods for password reset

After completing this module, students will be able to:

- Managing Identities using Azure Active Directory

AZ-300T02: Implementing Workloads and Security

Module 1: Evaluating and Performing Server Migration to Azure

This module covers migrating workloads to a new environment, whether it be another datacenter, or to a public cloud, and setting clear goals for the migration. Goals include both technology-focused and business-focused goals for migrations, and the benefits to an organization’s business. Activities include components of the Azure migration process: creating a project, creating a collector, assessing readiness, and estimating costs. Additionally, you will receive and overview of Azure Site Recovery (ASR) that includes and end-to-end scenarios.

After completing this module, students will be able to:

- Evaluating and Performing Server Migration to Azure

Module 2: Implementing and Managing Application Services

This module includes the following topics:

- Deploying Web Apps
- Managing Web Apps
- App Service Security
• Serverless Computing Concepts
• Managing Event Grid
• Managing Service Bus
• Managing Logic App

After completing this module, students will be able to:
• Implementing and Managing Application Services

Module 3: Implementing Advanced Virtual Networking

This module includes the following topics:
• Azure Load Balancer
• Azure Application Gateway
• Site-to-Site VPN Connections As well as an overview of ExpressRoute which allows companies to extend on-premises networks into the Microsoft cloud over a dedicated private connection facilitated by a connectivity provider.

After completing this module, students will be able to:
• Implementing Advanced Virtual Networking

Module 4: Securing Identities

This module includes the following topics with an emphasis on identity and roles:
• Azure AD Identity Protection
• Azure Domains and Tenants
• Azure Users and Groups
• Azure Roles As well as an overview of Azure AD integration options that focuses on Azure AD Connect to integrate on-premises directories with Azure Active Directory

After completing this module, students will be able to:
• Securing Identities using Azure AD

AZ-300T03: Understanding Cloud Architect Technology Solutions

Module 1: Selecting Compute and Storage Solutions

This module includes the following topics:
• Azure Architecture Center
• Cloud design patterns
• Competing consumers pattern
• Cache-aside pattern As well as sharding patterns to divide a data store into horizontal partitions, or shards. Each shard has the same schema but holds its own distinct subset of the data.

After completing this module, students will be able to:
• Design and Connectivity Patterns

Module 2: Hybrid Networking

This module includes the following topics:
• Site-to-site connectivity
• Point-to-site connectivity
• Combining site-to-site and point-to-site connectivity
• Virtual network-to-virtual network connectivity As well as connecting across cloud providers for failover, backup, or even migration between providers such as AWS

After completing this module, students will be able to:
• Hybrid Networking

• Structured and unstructured data
• Using structured data stores

After completing this module, students will be able to:
• Address Durability of Data and Caching
• Measure Throughput and Structure of Data Access

AZ-300T04: Creating and Deploying Apps

Module 1: Creating Web Applications using PaaS

This module provides an overview of Azure App Service Web Apps for hosting web applications, REST APIs, and a mobile back end. Topics include the following:
• Using shell commands to create an App Service Web App
• Creating Background Tasks
• Using Swagger to document an API

As well as an explanation of how Logic Apps help to build solutions that integrate apps, data, systems, and services across enterprises or organizations by automating tasks and business processes as workflows

After completing this module, students will be able to:
• Use shell commands to create an App Service Web App
• Create Background Tasks
• Use Swagger to document an API

Module 2: Creating Apps and Services Running on Service Fabric

This module provides an overview of Azure Service Fabric as a distributed systems platform that makes it easy to package, deploy, and manage scalable and reliable microservices and containers. This module also addresses the challenges in developing and managing cloud native applications. Additional topics include:
• Creating a reliable service
• Creating a Reliable Actors app
• Working with Reliable collections

After completing this module, students will be able to:
• Create a reliable service
• Create a Reliable Actors app
• Hands-on with Reliable collections

Module 3: Using Azure Kubernetes Service

This module focuses on the Azure Kubernetes Service (AKS) for deploying and managing a Kubernetes cluster in Azure. Topics include how to reduce operational overhead of managing Kubernetes by offloading much of that responsibility to Azure, such as health monitoring and maintenance. Additional topics include:

• Azure Container Registry
• Azure Container Instances

After completing this module, students will be able to:

Understand the Azure Container Registry
Use Azure Container instances

AZ-300T06: Developing for the Cloud

Module 1: Developing Long-Running Tasks and Distributed Transactions

Topics for this module include:
• Implementing large-scale, parallel, and high-performance apps using batches
• HPC using Microsoft Azure Virtual Machines
• Implementing resilient apps by using queues As well as, implementing code to address application events by using webhooks. Implementing a webhook gives an external resource a URL for an application. The external resource then issues an HTTP request to that URL whenever a change is made that requires the application to take an action

Module 2: Configuring a Message-Based Integration Architecture

Lessons
• Configure an app or service to send emails
• Configure an event publish and subscribe model
• Configure the Azure Relay service
• Configure apps and services with Microsoft Graph

After completing this module, students will be able to:
• How to configure a message-based integration architecture

Module 3: Developing for Asynchronous Processing

Lessons
• Implement parallelism, multithreading, and processing
• Implement Azure Functions and Azure Logic Apps
• Implement interfaces for storage or data access
• Implement appropriate asynchronous computing models
• Implement autoscaling rules and patterns

After completing this module, students will be able to:
• Understand how to Develop for Asynchronous Processing

Module 4: Developing for Autoscaling
Lessons
• Implementing autoscaling rules and patterns
• Implementing code that addresses singleton application instances
• Implementing code that addresses a transient state

After completing this module, students will be able to:
• Begin creating apps for Autoscaling

Module 5: Developing Azure Cognitive Services Solutions
Lessons
• Developing Solutions using Computer Vision
• Developing solutions using Bing Web Search
• Developing solutions using Custom Speech Service
• Developing solutions using QnA Maker

After completing this module, students will be able to:
• Understand Azure Cognitive Services Solutions

Module 6: Develop for Azure Storage
Lessons
• Develop Solutions that use Azure Cosmos DB Storage
• Develop Solutions that use a Relational Database
• Modeling a Database by using Entity Framework Core
• Develop Solutions that use Microsoft Azure Blob Storage
• Manipulating Blob Container Properties in .NET

After completing this module, students will be able to:
• Understand Azure Storage services such as blobs and Cosmos DB
